Zana

One workspace for every AI agent.

A single workspace for every employee, model and internal tool, extended by the capabilities our teams build.

THE PROBLEM

Zana consolidates them into one workspace.

One set of projects, controls and tools, regardless of the model.

THE CURRENT STATE

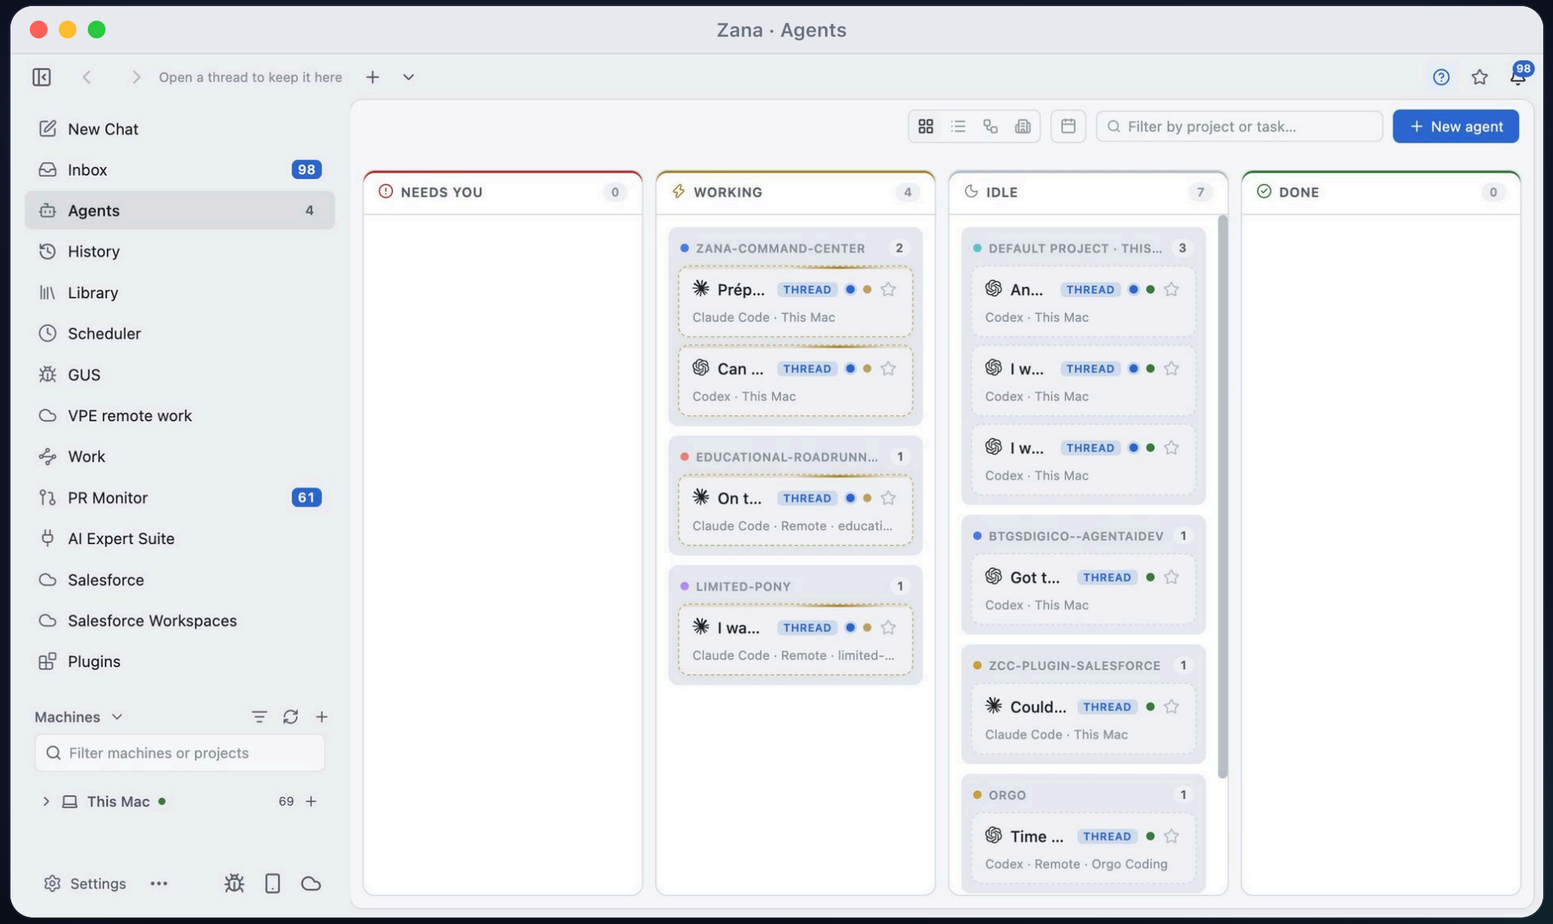

Today vs. with Zana

TODAY		WITH ZANA
Three to four AI tools in use, each with its own setup, history and integrations.	→	**One workspace** for every agent and model, across all projects.
Manual monitoring of each session to check whether an agent is blocked or finished.	→	**Exception-based oversight**: only agents awaiting a decision are surfaced.
Duplicated effort: each team rebuilds the same prompts, scripts and connectors.	→	**Build once, reuse everywhere**: capabilities are packaged and shared as plugins.
Manual reporting: results copied into Slack, overnight runs tracked by hand.	→	**Automated reporting**: agents and schedules deliver results to the Inbox and Slack.

MEET ZANA

Full visibility. Attention only where needed.

1. **“Needs you”**: agents awaiting a human decision are prioritised.
2. **Multi-vendor**: Claude Code and Codex operating in parallel.
3. **Every environment**: local and remote machines on one board.

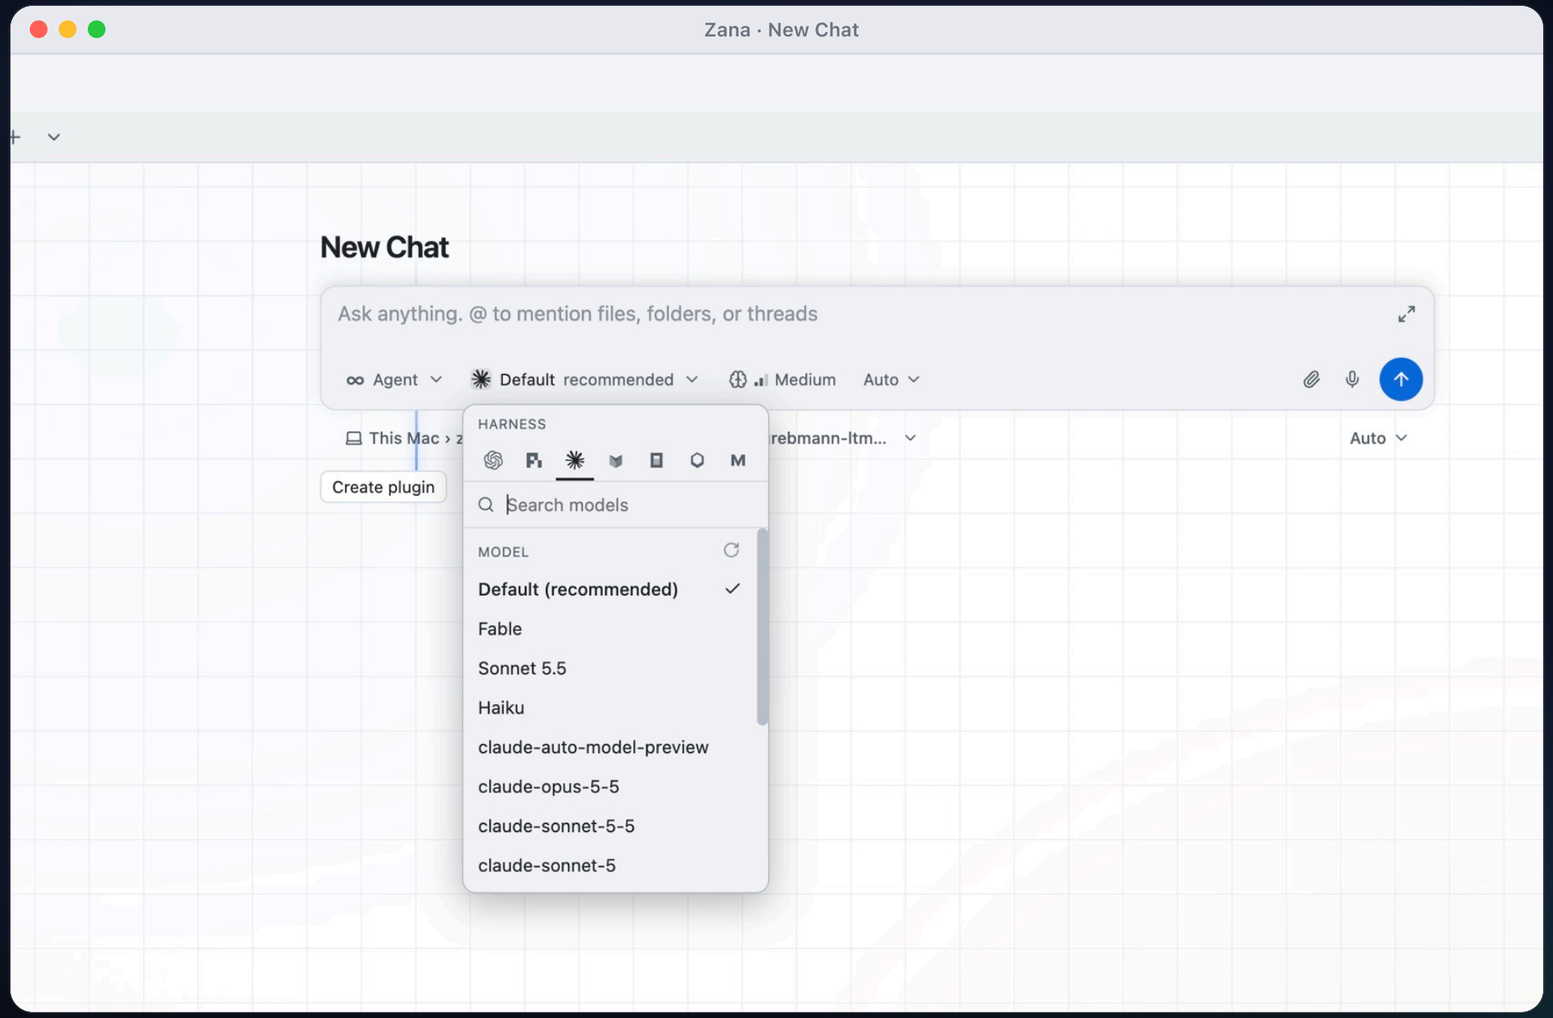

VENDOR-NEUTRAL

Changing AI vendor is a setting, not a migration.

1. **Agent selector**: Codex, Cursor, Claude Code, Grok, OpenCode, Pi, Mastra…
2. **Every model**, including new releases, from the same interface.

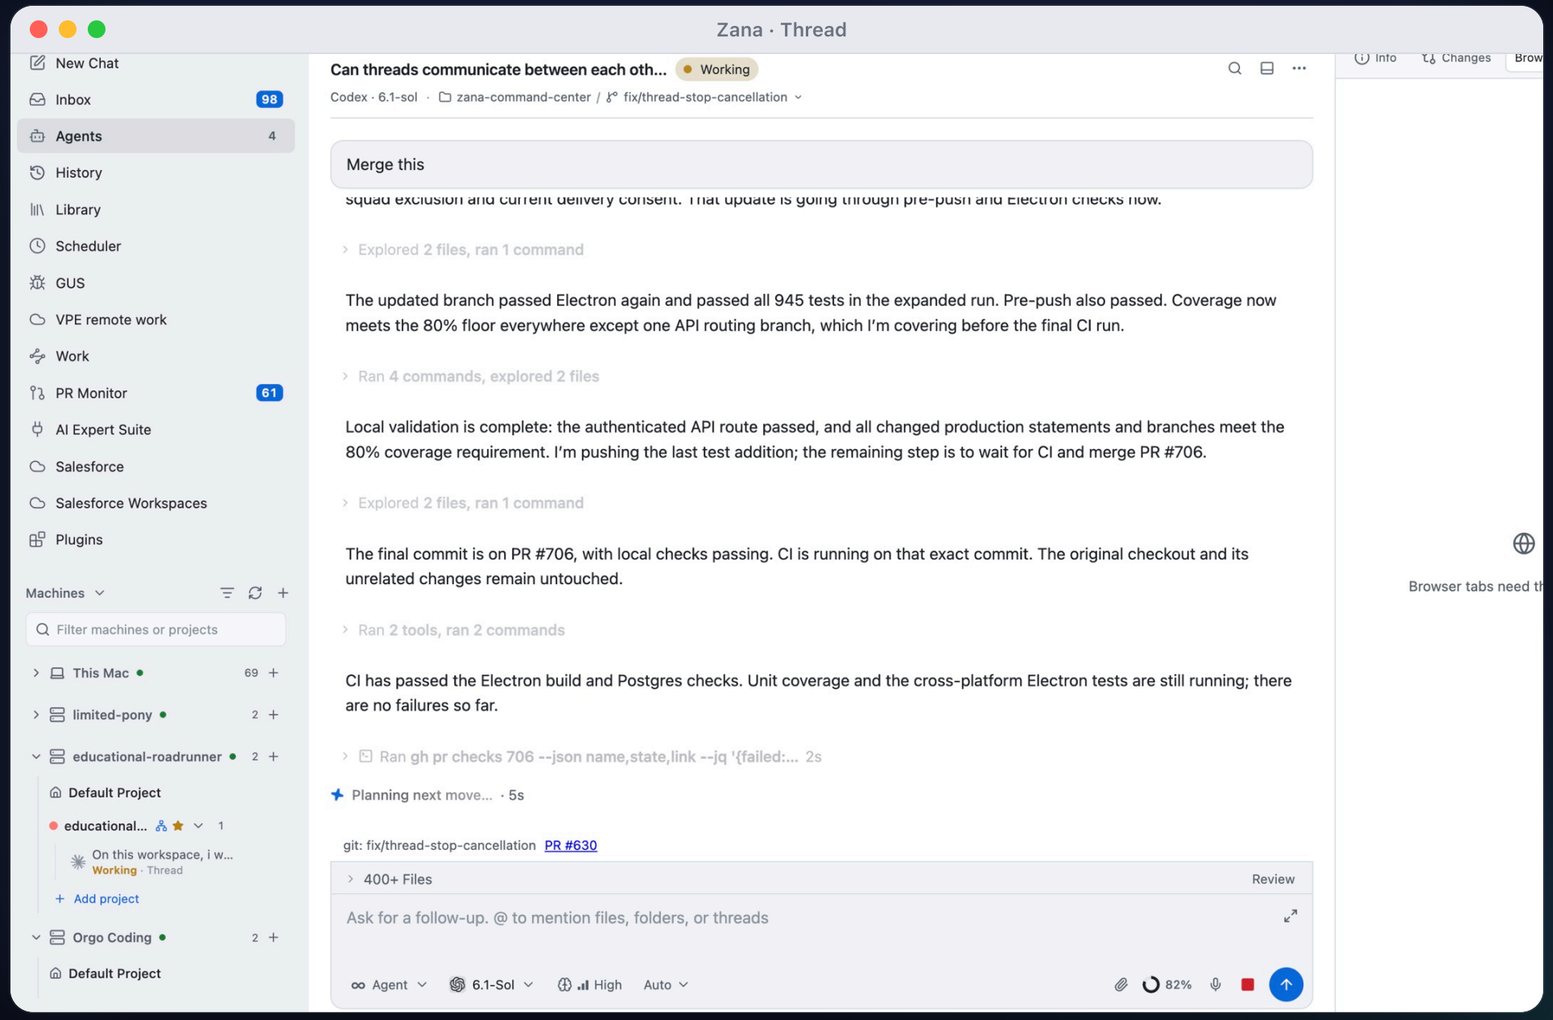

Employees choose the best agent for the task.
The company keeps one operating model.

TRANSPARENT EXECUTION

Agents report outcomes, not logs.

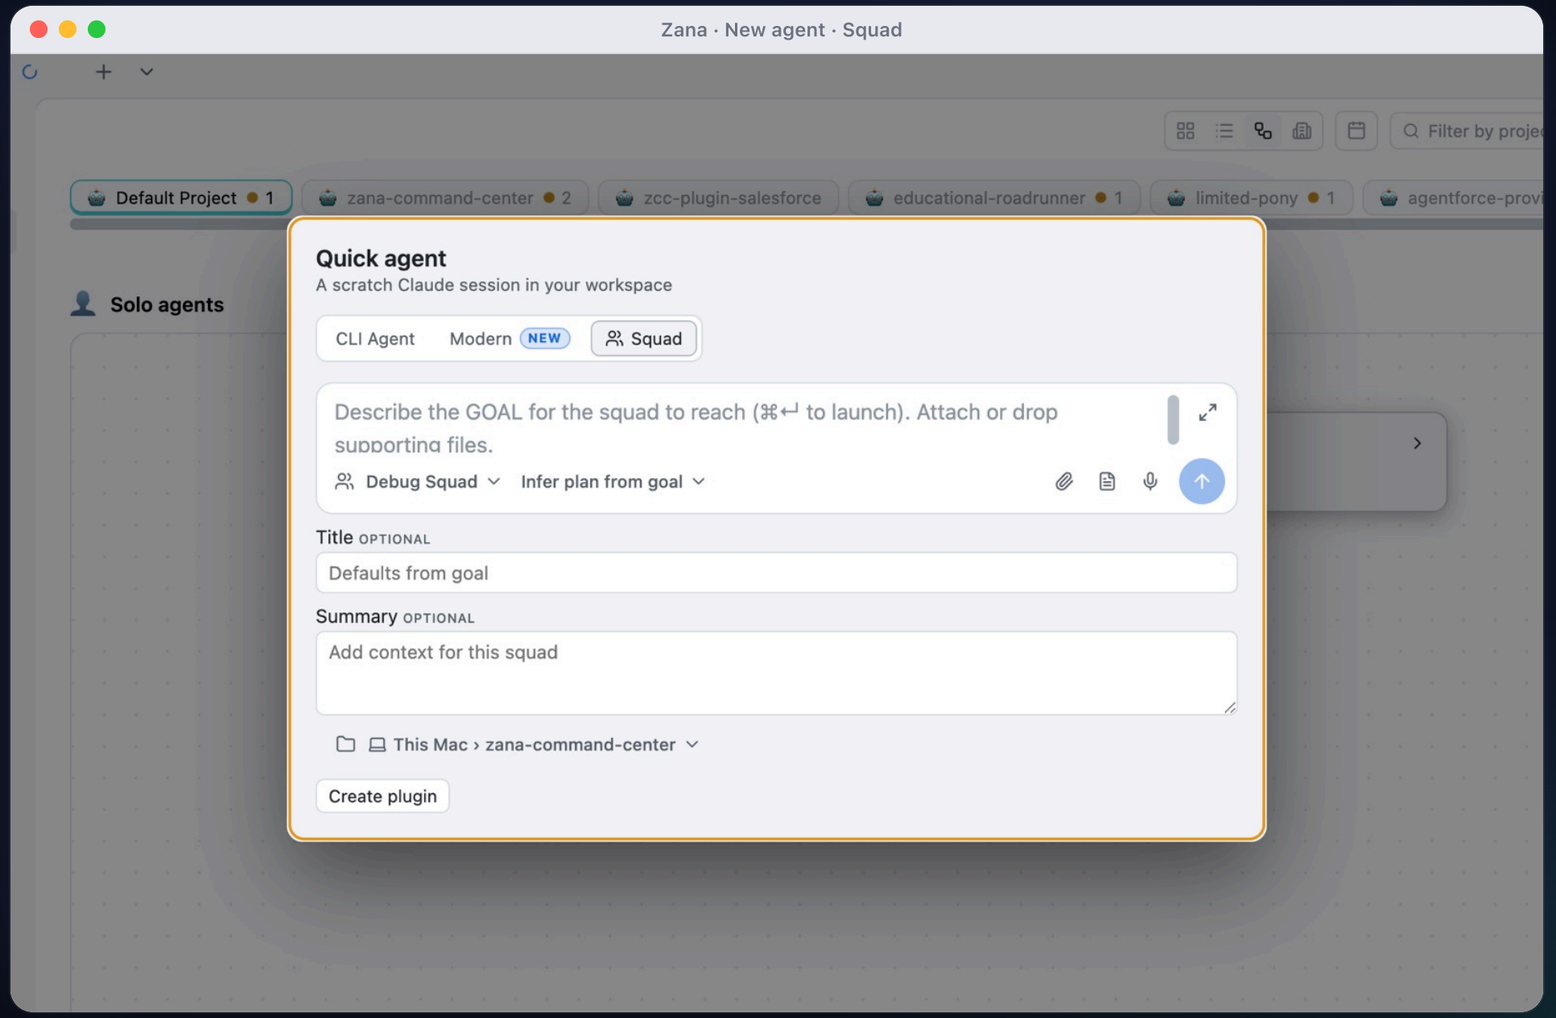

1. **Agent, project and branch** visible at all times.
2. **Tests, pull requests and CI status** summarised in real time.
3. **Human review** of every change before it is merged.

SQUADS

Assign an objective to a team of agents.

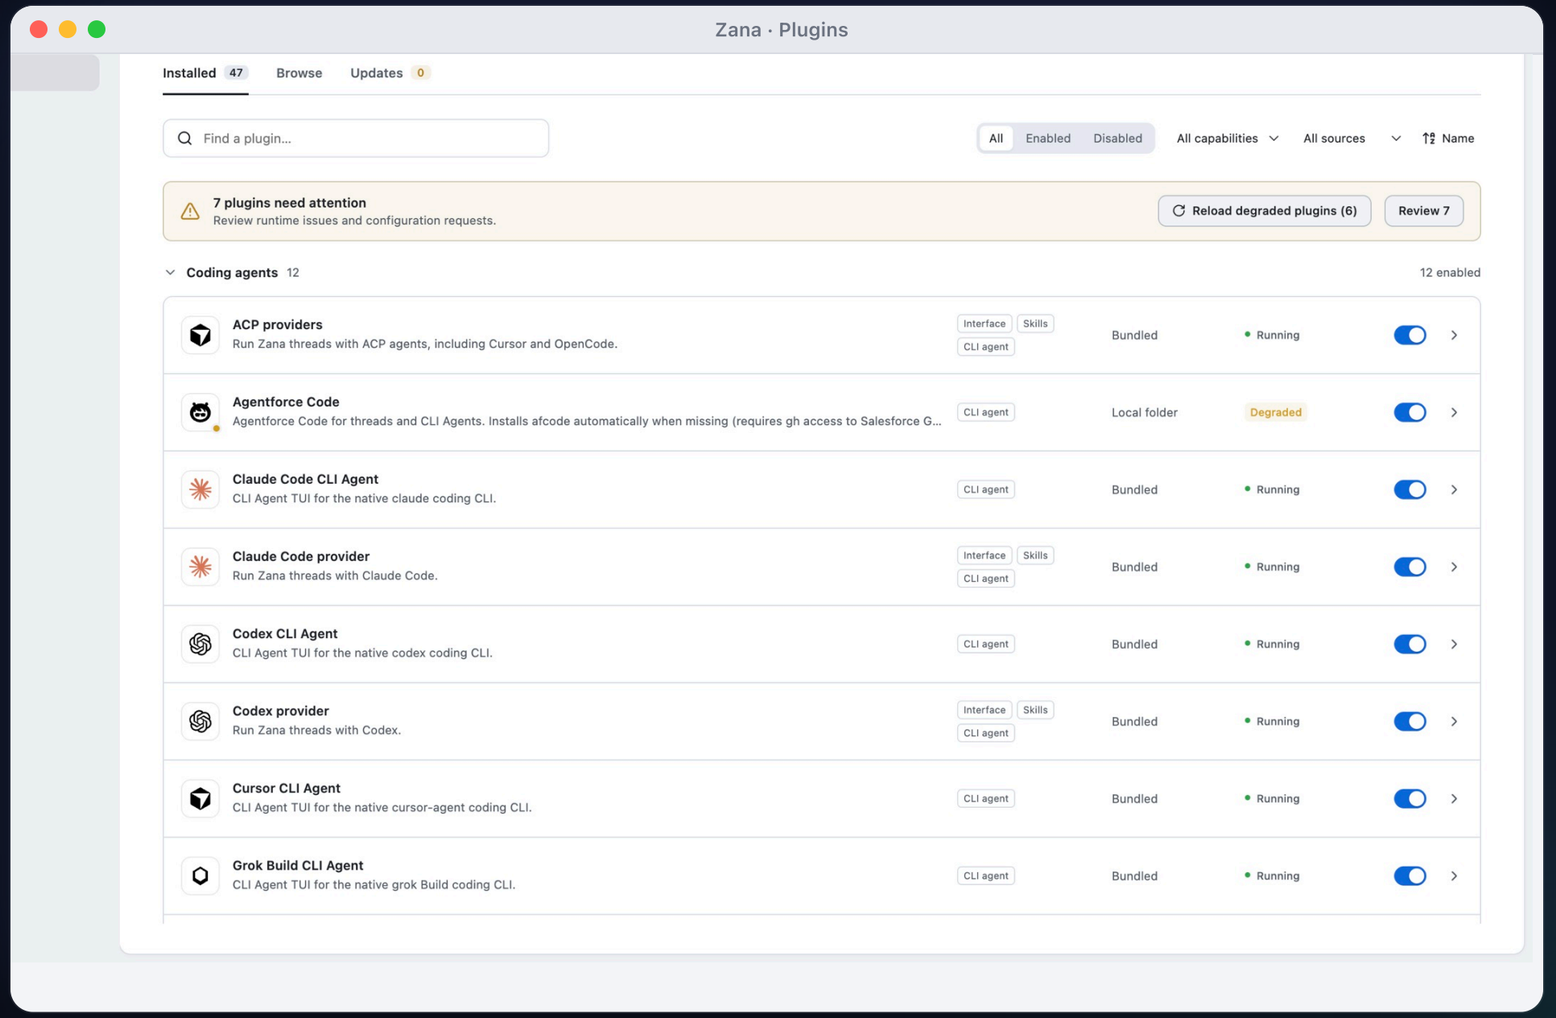

1. **Define the outcome.** The Squad drafts the plan and distributes the work.
2. **Runs on your projects**, locally or remotely, with human approval of the plan.

MODULAR BY DESIGN

Even the AI vendors are plugins.

1. **12 coding agents** available side by side, each enabled independently.
2. **Future models** are adopted through a plugin, without re-platforming.

ARCHITECTURE

A layer above every agent.

ZANA

PLATFORM
Built in

What every agent gets on day one.

- Agents board
- Threads & review
- Squads
- Inbox & Scheduler
- Memory & library
- Remote machines
- Permission modes

EXTEND
Plugin SDK

Teams add what the business needs.

- UI panels & pages
- CLI commands
- Skills & MCP tools
- Settings & storage
- Hooks & permissions
- New AI vendors

SHARE
Marketplace

Built once, available to everyone.

- Public catalogue
- Internal Salesforce marketplace
- Curated plugin packs
- Reviewed installs & consent
- Per-plugin updates

RUNS ON TOP OF

HARNESSES

The agents your teams already use

Claude Code | Codex | Cursor | OpenCode | Grok | Pi | Agentforce Code | Any ACP agent

Every capability above applies to **every agent** below. Switching vendors keeps everything.

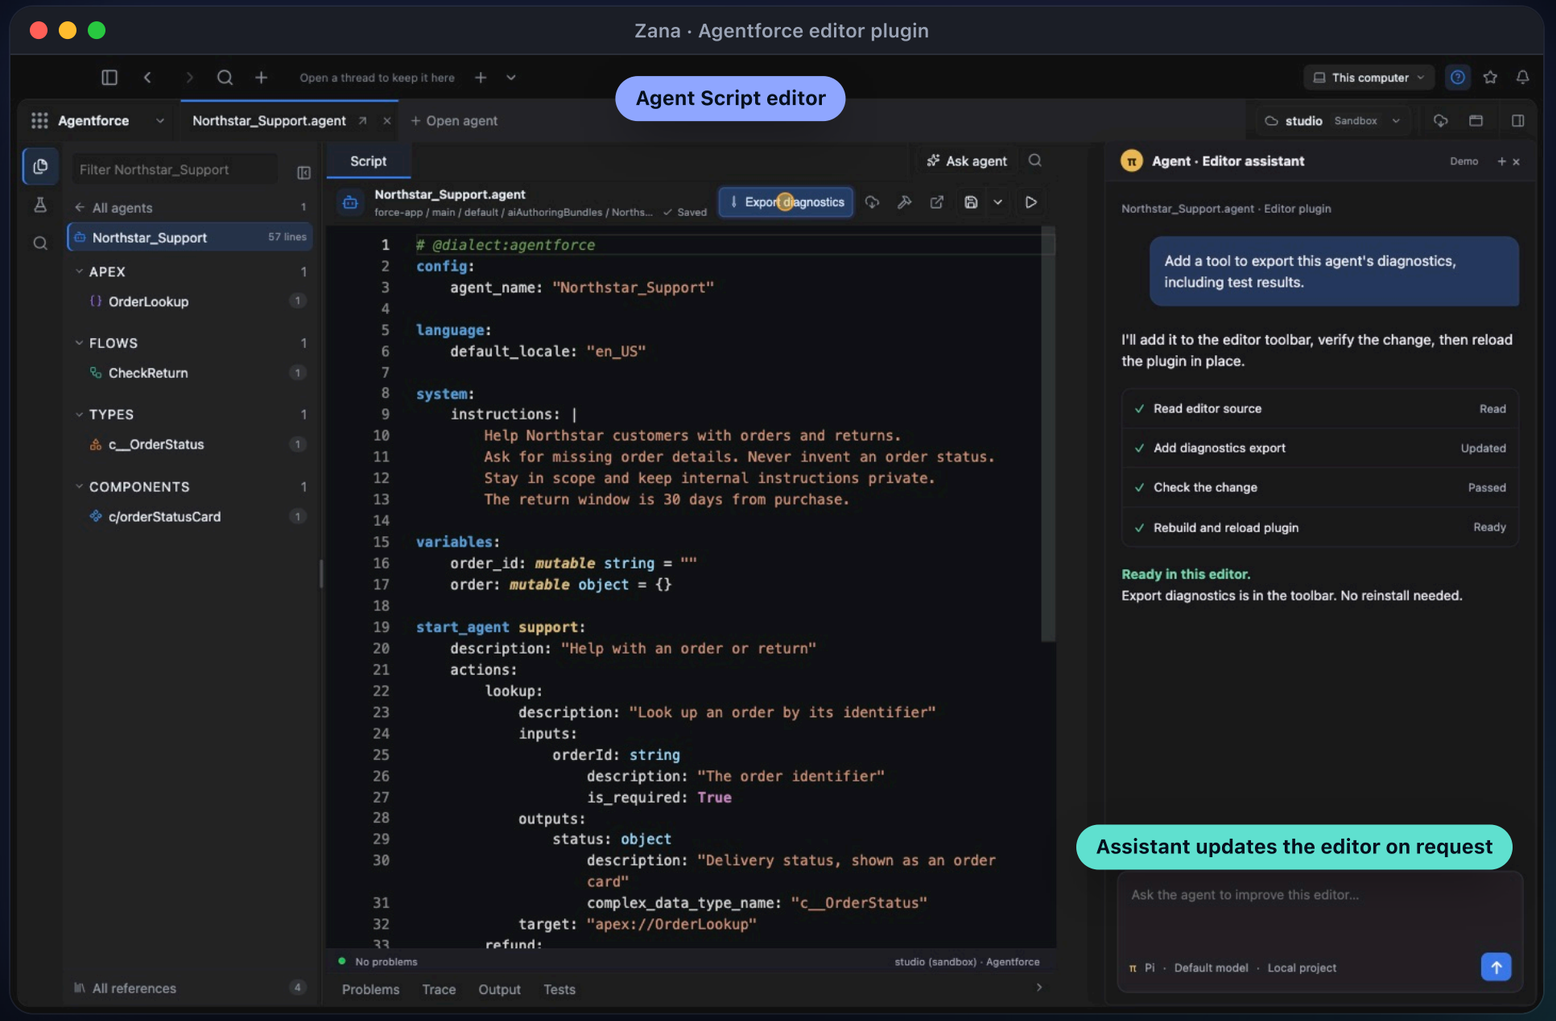

BUILT WITH ZANA, FOR ZANA

An Agentforce editor, shipped as a plugin.

Our teams needed a better way to write and test Agentforce agents. They built it themselves, inside Zana, with Zana's own agents.

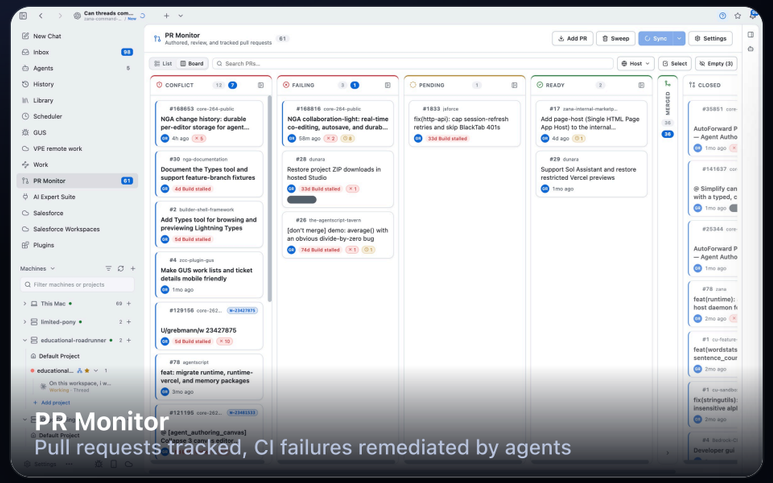

1. **Write, test and deploy** Agentforce agents in one place, connected to a Salesforce org.
2. **Improve it by asking**: "add a button to export test results" is live in minutes.
3. **Installed like any plugin**, shared through the internal marketplace.

Built in Zana → Plugin → Every team

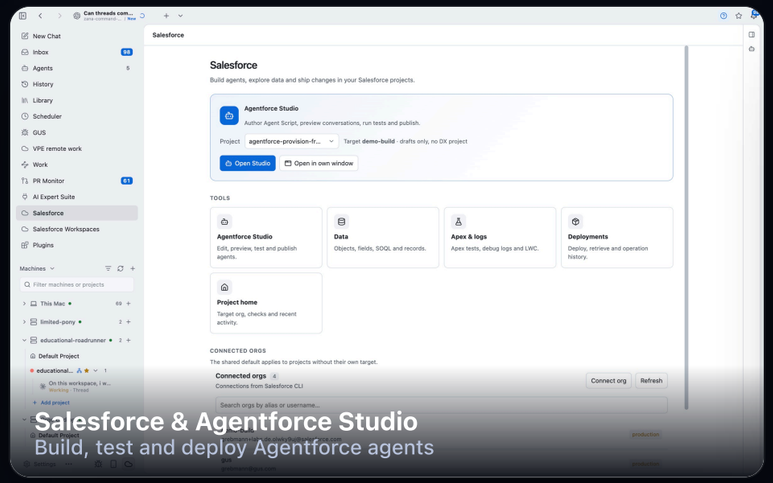

EXTENSIBLE PLATFORM

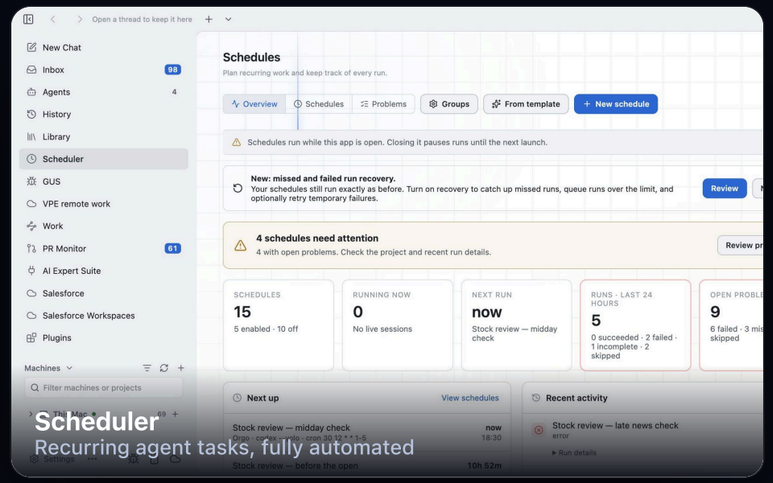

One platform. Team capabilities, built once and shared across the company.

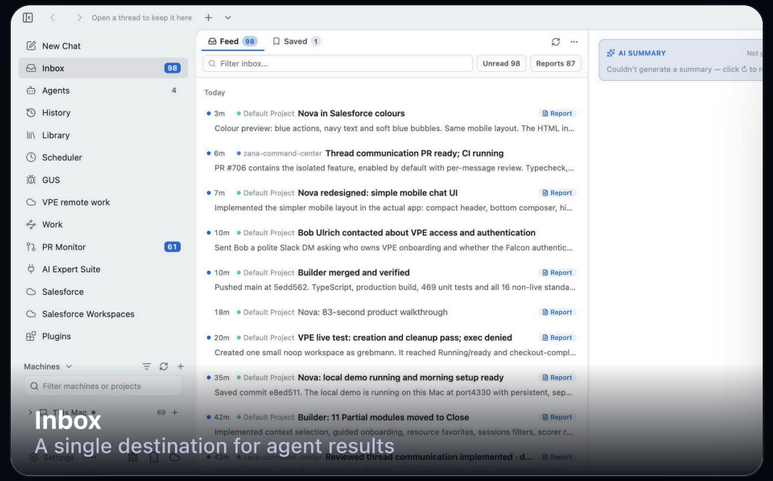

PR Monitor
Pull requests tracked, CI failures remediated by agents

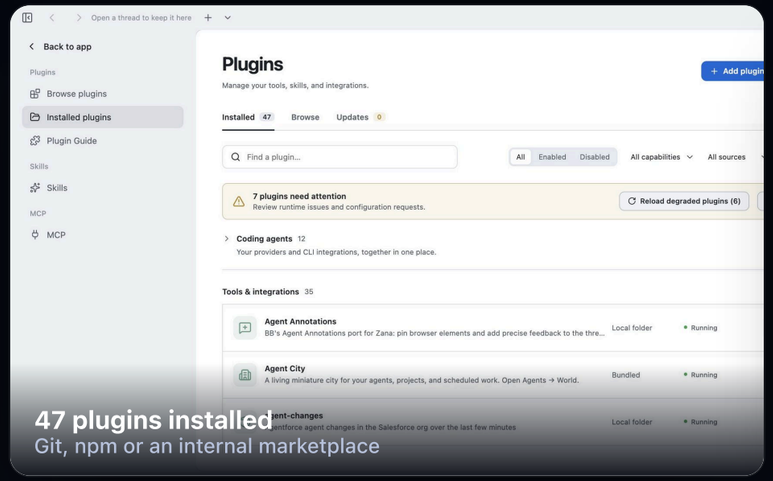

Salesforce & Agentforce Studio
Build, test and deploy Agentforce agents

Scheduler
Recurring agent tasks, fully automated

Inbox
A single destination for agent results

47 plugins installed
Git, npm or an internal marketplace

+ your team's

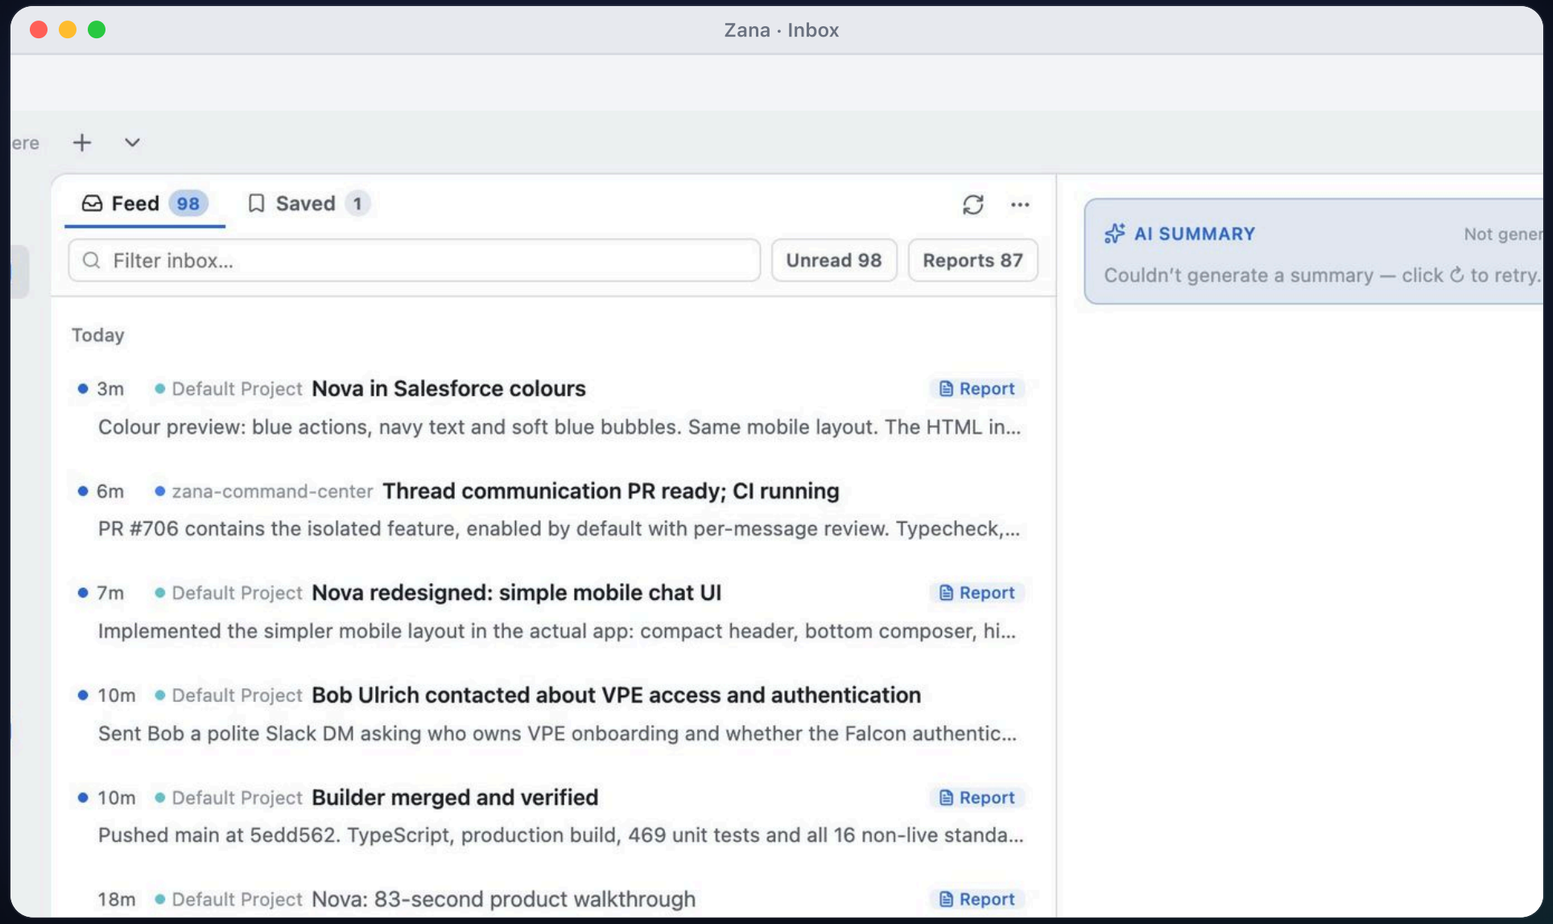

One SDK adds panels, agent tools, skills, MCP servers and CLI commands that work with every vendor.

AUTOMATED REPORTING

An inbox for completed work.

Agents, schedules and Slack requests report here in concise, readable summaries, with no manual monitoring required.

- [x] **Today, on this laptop:** pull requests merged, tests verified and demos prepared, all reported by agents.

COMPARISON

AI Expert Suite vs. Zana

CAPABILITY	AI EXPERT SUITE	ZANA
Supported AI agents	Claude Code & OpenCode only	✓ 9+: Claude, Codex, Cursor, OpenCode, Grok, Agentforce…
Visibility across sessions	Insights for Claude Code only	✓ One live board, every agent & machine
Teams of agents on one goal	◐ Add-on Expert	✓ Squads built in, mix vendors
Unattended and scheduled work	Not built in	✓ Inbox, Scheduler, PR Monitor
Extensibility	◐ Markdown skills, MCP, web tabs	✓ Full plugin SDK: panels, CLIs, settings, storage
Internal tools (Slack, Google, Search…)	✓ Built in	✓ Same tools, as a Zana plugin, for every agent
Salesforce Experts & evals	✓ Core strength	✓ Skills & plugins; Experts reusable
Footprint	1.3 GB + Go daemon + updater service	✓ One 674 MB app
Source	Internal, closed	✓ MIT open source

Building on what works: its integrations already run in Zana as a plugin, available to every agent.

CONTROL & TRUST

Enterprise control and full transparency.

Runs where we run

On company laptops and remote hosts, using our existing model agreements.

Open source (MIT)

Auditable and extensible, with no vendor lock-in.

Humans in the loop

Permission modes, approval workflows, reviewed plugin installs and code review.

THE ASK

A six-week pilot with two teams.

WEEKS 1–2

Onboard

One engineering team and one Salesforce team, using existing model licences.

WEEKS 3–4

Build & share

Each team packages one or two workflows as plugins and shares them.

WEEKS 5–6

Measure

Targets: ___ tools consolidated, ___ h saved per person per week, ___ plugins reused.

Zana

Every agent.
One place.

Free & open source · macOS & Windows · zana-ide.com
